COLORADO SCHOOL OF MINES

Homework submitted for the Nuclear Fuel Cycle class at the  
Colorado School of Mines.

FALL 2017

## TABLE OF CONTENTS

|                                   | Page     |
|-----------------------------------|----------|
| <b>1 Nuclear Fuel Fabrication</b> | <b>1</b> |
| 1.1 Problem 4-3 . . . . .         | 1        |
| 1.1.1 Problem . . . . .           | 1        |
| 1.1.2 Solution . . . . .          | 1        |
| 1.2 Problem 4-4 . . . . .         | 2        |
| 1.2.1 Problem . . . . .           | 2        |
| 1.2.2 Solution . . . . .          | 2        |
| <b>Bibliography</b>               | <b>3</b> |

## NUCLEAR FUEL FABRICATION

Several problems related to the fuel fabrication are tackled in this fourth homework. These are the problems 4-3 and 4-4 from the textbook.

## 1.1 Problem 4-3

### 1.1.1 Problem

*Calculate the cost of nuclear fuel fabricated and delivered on-site using the following data: Cost of natural uranium, 60\$/lb; U3O8 enrichment, 4.2%; conversion, \$11.50/kgU; tails, 0.25%; price of SWU, \$110; conversion loss, 0.6%; fabrication and transportation cost, \$230/kgU; fabrication loss, 0.7%.*

### 1.1.2 Solution

Equation 4.1 in the book states that:

$$(1.1) \quad FF = \left[ \frac{PU}{(1-l_c)(1-l_f)} + \frac{PC}{(1-l_f)} \right] \frac{F}{P} + \frac{PS}{(1-l_f)} * SF + PF$$

In the data,  $PU$  is given in \$/lbU3O8.  $PU = \$60/lbU3O8 = \$156/kgU$ .

Plugging the numbers in, we obtain the cost of nuclear fuel fabricated and delivered on-site  $FF = \$2375$ .

## 1.2 Problem 4-4

### 1.2.1 Problem

*If the enrichment changes by 0.4%, that is, goes from 4.2% to 4.6%, by what percentage does the cost of fuel in problem 4-3 change?*

### 1.2.2 Solution

We can change the enrichment to 4.6% in Equation 4.1 (present in the factor  $F/P$ , itself present in the factor  $SF$ ). This causes the cost of nuclear fuel fabricated and delivered on-site to increase to  $FF = \$2615$ . This represents a change of 10.1%.
