## REACTOR HEAT GENERATION

Several exercises from the book written by M. M. El Wakil [1] are tackled in this homework. The problems in this section relate to the fifth chapter of the book, covering the subject of heat conduction in reactor elements.

## 1.1 [G1] - Fine mesh cruciform

### 1.1.1 Problem

*Calculate the temperature in a cruciform with a mesh  $\Delta x = \Delta y = 0.1$ .*

### 1.1.2 Solution

We can define the origin, taken at the center of the cruciform, to be  $T(0,0)$ . By symmetry, we know that  $T(i,j) = T(-i,j)$  and  $T(i,j) = T(i,-j)$ . Consequently, the solution will be complete when  $T(i,j), i \in [0,11], j \in [0,1]$  are computed. By symmetry, we also know that  $T(0,1) = T(1,0)$ , so we can get rid of  $T(0,1)$  in our computation.

We can approximate the temperature at these discrete points by using Equation 1.1, knowing that  $\Delta x = \Delta y$ .

$$(1.1) \quad T_n = \frac{T_{n+\Delta x} + T_{n-\Delta x} + T_{n+\Delta y} + T_{n-\Delta y}}{4} + \frac{\Delta T_g}{2}$$

Where, in the case of uniform heat generation:

$$\Delta T_g = \frac{(\Delta x)^2 q'''}{2k}$$

In our case, we consider  $q''' = 1 \times 10^7$  and  $k = 19.84$ . Consequently,  $\Delta T_g = 17.5^\circ F$ . We also consider a surface temperature of  $600^\circ F$ .

Our goal is to solve the matrix Equation 1.2 for  $x$ .

$$(1.2) \quad A.x = b$$

We can calculate a few values in order to construct the matrice  $A$  and  $b$ , using Equation 1.1. We can obtain:

$$(1.3) \quad T(0,0) = T(1,0) + \frac{\Delta T_g}{2} \Rightarrow T(0,0) - T(1,0) = \frac{\Delta T_g}{2}$$

$$(1.4) \quad T(1,0) = \frac{T(0,0) + T(2,0) + 2T(1,1)}{4} + \frac{\Delta T_g}{2} \Rightarrow T(1,0) - \frac{T(0,0)}{4} - \frac{T(2,0)}{4} - \frac{T(1,1)}{2} = \frac{\Delta T_g}{2}$$

$$(1.5) \quad T(1,1) = \frac{2T(1,0) + 2T(2,1)}{4} + \frac{\Delta T_g}{2} \Rightarrow T(1,1) - \frac{T(1,0)}{2} - \frac{T(2,1)}{2} = \frac{\Delta T_g}{2}$$

$$(1.6) \quad T(2,0) = \frac{T(1,0) + T(3,0) + 2T(2,1)}{4} + \frac{\Delta T_g}{2} \Rightarrow T(2,0) - \frac{T(1,0)}{4} - \frac{T(3,0)}{4} - \frac{T(2,1)}{2} = \frac{\Delta T_g}{2}$$

$$(1.7) \quad \begin{aligned} T(2,1) &= \frac{T(1,1) + T(3,1) + T_S + T(2,0)}{4} + \frac{\Delta T_g}{2} \\ \Rightarrow T(2,1) - \frac{T(1,1)}{4} - \frac{T(3,1)}{4} - \frac{T(2,0)}{4} &= \frac{T_S}{4} + \frac{\Delta T_g}{2} \end{aligned}$$

$T(i,0)$  and  $T(i,1)$  for  $i \in [2, 10]$  will be identical, given the geometry of the problem.

$$(1.8) \quad T(11,0) = \frac{T(10,0) + 2T(11,1) + T_S}{4} + \frac{\Delta T_g}{2} \Rightarrow T(11,0) - \frac{T(11,1)}{2} - \frac{T(10,0)}{4} = \frac{T_S}{4} + \frac{\Delta T_g}{2}$$

$$(1.9) \quad T(11,1) = \frac{T(11,0) + T(10,1) + 2T_S}{4} + \frac{\Delta T_g}{2} \Rightarrow T(11,1) - \frac{T(11,0)}{4} - \frac{T(10,1)}{4} = \frac{T_S + \Delta T_g}{2}$$

Consequently, we can write  $A$ :

$$A_{0 \rightarrow 11} = \begin{bmatrix} 1 & -1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ -0.25 & 1 & -0.5 & -0.25 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & -0.5 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & -0.25 & 0 & 1 & -0.5 & -0.25 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & -0.25 & -0.25 & 1 & 0 & -0.25 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & -0.25 & 0 & 1 & -0.5 & -0.25 & 0 & 0 & 0 & 0 & 0 & 0 & \dots \\ 0 & 0 & 0 & 0 & -0.25 & -0.25 & 1 & 0 & -0.25 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & -0.25 & 0 & 1 & -0.5 & -0.25 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & -0.25 & -0.25 & 1 & 0 & -0.25 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & -0.25 & 0 & 1 & -0.5 & -0.25 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -0.25 & -0.25 & 1 & 0 & -0.25 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -0.25 & 0 & 1 & -0.5 & -0.25 & 0 \end{bmatrix}$$

[illegible]

And we can also write  $b$ :

[illegible]

We can now solve Equation 1.2, using Python. The python script is given in 1.1.2.1. We obtain the following results (Equation 1.10):

$$\begin{aligned}
 (1.10) \quad & T(0,0) = 723.8 \\
 & T(1,0) = 715.1 \\
 & T(1,1) = 703.2 \\
 & T(2,0) = 695.1 \\
 & T(2,1) = 673.8 \\
 & T(3,0) = 682.5 \\
 & T(3,1) = 662.0 \\
 & T(4,0) = 675.9 \\
 & T(4,1) = 656.8 \\
 & T(5,0) = 672.5 \\
 & T(5,1) = 654.3 \\
 & T(6,0) = 670.6 \\
 & T(6,1) = 652.9 \\
 & T(7,0) = 668.9 \\
 & T(7,1) = 651.8 \\
 & T(8,0) = 666.7 \\
 & T(8,1) = 650.2 \\
 & T(9,0) = 662.5 \\
 & T(9,1) = 647.2 \\
 & T(10,0) = 654.0 \\
 & T(10,1) = 641.1 \\
 & T(11,0) = 636.3 \\
 & T(11,1) = 628.1
 \end{aligned}$$

### 1.1.2.1 Python script

```
import numpy as np

m = 23
dx = 0.1
deltax, k, qtriple = (dx/12), 19.84, 1.e7
ts = 600.
dtg = (0.5*deltax**2)*qtriple/k

amat = np.zeros((m,m))
b = np.zeros(m)

amat[0,0] = 1.
amat[0,1] = -1.
b[0] = dtg/2.

amat[1,0] = -0.25
amat[1,1] = 1.
amat[1,2] = -0.5
amat[1,3] = -0.25
b[1] = dtg/2.

amat[2,1] = -0.5
amat[2,2] = 1.
amat[2,4] = -0.5
b[2] = dtg/2.

for i in range(3, m, 2):
    try:
        amat[i,i-2] = -0.25
        amat[i,i] = 1.
        amat[i,i+1] = -0.5
        amat[i,i+2] = -0.25
        b[i] = dtg/2.
    except IndexError:
        break

for i in range(4, m, 2):
    try:
        amat[i,i-2] = -0.25
        amat[i,i-1] = -0.25
        amat[i,i] = 1.
        amat[i,i+2] = -0.25
        b[i] = ts/4. + dtg/2.
    except IndexError:
        break

amat[m-1,m-1] = 1.
amat[m-1,m-2] = -0.25
amat[m-1,m-3] = -0.25
b[m-1] = ts/2. + dtg/2.
```

```
amat[m-2,m-2] = 1.
amat[m-2,m-1] = -0.5
amat[m-2,m-4] = -0.25
b[m-2] = ts/4. + dtg/2.

ysol = np.linalg.solve(amat,b)

print('Temperature solution:')

temp = []
for i in range(12):
    for j in range(2):
        if i == 0 and j == 1:
            continue
        temp.append("T(%s,%s)" % (i, j))

for i,t in enumerate(temp):
    print("%s = %.1f" % (t, ysol[i]))

# check of solution:
if not np.allclose(np.dot(amat, ysol), b):
    print("Solution does not match!")
```
